

Smart Wi-Fi Plug Information to Operate the Super Feeder®

First, be sure to adjust your Super Feeder's desired portion size by plugging the power supply into a power outlet and adjusting the feed duration controller with the little supplied plastic screwdriver as explained in your feeder's manual or video. Then plug the power supply into the Smart Plug after you have installed it just like you would to turn on a lamp or other appliance.

Wi-Fi Smart Plugs available on our store that we tested and recommend for indoor or outdoor use: The indoor type 120V Kasa Smart Wi-Fi Plug HS103 mini and the 120V Kasa Smart Wi-Fi Outdoor Plug EP40 with 2 individually controlled power outlets.

Available on our store: The indoor Kasa HS103 mini or outdoor EP40 Smart Plugs will control/trigger your Super Feeder remotely at programmed times. They are by far the best and easiest we tested to install and use. Just follow directions included with the Smart Wi-Fi Plug. Just follow directions included with the Smart Wi-Fi Plug. All you will need to do once installed is program suggested **2** minutes of "ON" time for each time you want to feed your pet. You **MUST** program "ON" **and** "OFF" times! i.e.: "ON" at 8:00 AM and "OFF" at 8:02 AM for each time of day or all week days you want to feed your pet, up to 15 times per day. The feeder will run only for the amount of time you previously adjusted it to give you the portion needed as described at top of this page and will stop on its own even while still powered. You may also "trigger" your Super Feeder any other time than programmed by manually/remotely turning it on for a few seconds and turning it back off yourself from your cell or other device. You may install several Wi-Fi Plugs and trigger several feeders in different places at the same exact time within range of your local Wi-Fi router. **Note:** The feeder must have been powered down for at least 1-2 minutes between feed cycles to assure it can reset itself and trigger again. If it has not been powered down long enough like repeatedly turning it on and off, the feeder will not trigger again, which is normal. You could also control the Super Feeder® by voice command using these Wi-Fi Smart Plugs with Amazon Alexa® and Google® accessories (not supplied). A TP-LINK® High quality Camera would be a great addition to monitor your pets and feeder. So many ways to operate your Super Feeder. This is what makes the Super Feeder so unique!

Note: Some other Wi-Fi systems offered on the market today can have a lot to be desired and may be incompatible with the Super Feeder. As an example, a Wi-Fi socket on the market may not work if it does not turn off completely (some do and some may not like used for dimming lights), meaning that any residual power coming out of it during its off time will prevent the feeder from resetting itself between programmed feed cycles and will thus prevent it from triggering and operating properly.

Various programmable timers can be used: Best of all with the Super Feeder, you still retain the option to use just about any type of common programmable lamp timer, digital or analog to operate your Super Feeder.
